

Power Steering Filter

The simple addition of a power steering filter can prolong the life of both an existing power steering system or protect a newly repaired system from premature failures and warranty issues. But not all filters are made the same. With our Edelmann Elite® filter, we pulled out all the stops to make sure the job gets done right the first time.

Universal Fitment

Interchangeable ends nearly guarantee fitment on any power steering system with 3/8", 1/2", and 5/8" return lines. That accounts for 99%+ of vehicles in operation today.

Higher Capacity

Our high capacity stainless steel mesh filter is nearly 3x as large as our competitors without sacrificing any filtration. That is 3x the ability to remove particulates as well as 3x the flow.

Dual Filtration

Additional to our larger filtration basket is the increased security from our dual filtration magnet designed to remove more metal shavings than the competition. Our magnetic filtration is 4x larger and stronger than our competition.

Serviceable

This filter is easy to clean and service. When used to prolong the life of a power steering system, this is important as it will remove all the particulate from the existing fluid. After a short time, removing the filter and cleaning out the debris will improve the performance of the power steering system.

Reduce Warranties

Eliminate the opportunity for warranty failures and repeat repairs by adding a filter whenever work is done to the power steering system. In many cases, if one part of the system is failing, it will degrade the performance of other components and likely lead to further repairs in the future. Add a filter with better fitment assurance and higher performance to reduce this possibility and do the repair once.

Do it right, the first time!
